Clone Stamp is your favorite tool for painting. However, if you have some experience with traditional paint techniques, you know you can do pretty impressive work with a brush and a little practice. **Eraser** allows you to erase away text or parts of images, much like rubbing out a pencil. You can also erase areas to mask off objects on an image. **Pencil** tools allow you to draw directly on the image, much like with traditional pen and ink or colored pencil techniques. You can draw on your image by tracing over and modifying existing paths, or by creating paths yourself. **Pen** tools are similar to a pencil tool, but they create freeform paths within the image instead of drawing the images you see. Pen tools can be used to draw freeform paths within an image, or to trace over existing paths. **Paths** are like the instructions that a printer uses to lay out an image on a page. A **Path** is a tool that allows you to draw more complex shapes than you can with a pencil or pen tool. You can draw a complex path by manually using points and control points; however, there are also tools that will help you draw paths that were drawn by someone else, or that are already present in the image. **Paint Bucket** allows you to fill a specified color or image area with a color of your choice. Colors can be converted to grayscale or used with image adjustment filters. **Brush** tools allow you to apply effects directly onto the image. **Fill** tools fill areas of an image with the specified color. **Gradient** tools allow you to seamlessly blend from one color to another color on the path you draw. **Eraser** tools allow you to erase areas of an image, like an eraser on paper. **Brush** or **Pen** tools allow you to draw directly on the image. **Paths** are instructions that tell Photoshop where to lay out your image. **Pen** and **Brush** tools are similar, but with slightly different results. **Layers** are the key to great image manipulation. They allow you to work on separate and individual images, as well as composite or retouch one layer over another. Layers work

Polymorphonuclear leukocyte activation during umbilical vein endothelial cell coculture. Umbilical vein endothelial cell (HUVEC) monolayers grown on filters are suitable for studies of cellular mechanisms involved in adherence of polymorphonuclear leukocytes (PMN) to these cells. Filter cultures of HUVEC were challenged with formyl-methionyl-leucyl-phenylalanine (fMLP), a bacterial chemotactic peptide. Adherence of PMN was significantly increased in response to fMLP in a dose-dependent manner. fMLP receptors were present on the HUVEC, since addition of 100 nM fMLP resulted in adherence of purified PMN that was inhibited by the addition of 100 micromolar pepstatin, an antagonist of formyl peptide receptors. This supported the hypothesis that the observed PMN adhesion is mediated by a direct interaction between fMLP, a chemoattractant, and its receptors on the HUVEC. Subsequent experiments were undertaken to determine whether HUVEC, in response to chemotactic peptides, cause the release of preformed chemotactic factors. Following stimulation with fMLP, supernatants from filter cultures of HUVEC were tested for chemotactic factors. PMN, in contrast to other cell types, were a chemotactic factor. PMN supernatants induced aggregation of PMN and stimulated superoxide release in response to opsonized zymosan. This study demonstrates that HUVEC produce a chemotactic factor for PMN, release cell-associated chemotactic factor(s) for PMN, and enhance adherence of PMN. These findings suggest that chemotactic peptides released from HUVEC may play a role in the recruitment and activation of PMN to sites of inflammation.

Long-term alcohol use and left ventricular filling in alcoholics: normal values. Echocardiographic measurements of the left ventricle were performed in 68 patients divided into three groups: untreated alcoholics, treated alcoholics, and healthy controls. No patient in the untreated alcoholic group was in a compensated stage. Left ventricular ejection fraction and fractional shortening values were significantly lower in the untreated alcoholics ($p < 0.001$) when compared to the other two groups, while left ventricular fractional area change was significantly lower only in the untreated alcoholics when compared to the healthy controls.
