BASIC Accelerator has been built to solve only two problems: How to program old BASIC programs without using '\$' or '&' prefix, and How to run old BASIC programs in Binary mode (8 bit binary floating point) using Lazarus. But user manuals for BASIC Accelerator can be downloaded from Since the release of BASIC Accelerator v1.9, the user has the possibility to choose the speed of the digitisation process. You can modify the digitisation speed in BASIC Accelerator options. There is also the

possibility to write programs whose input and output are ascii files, and in this case, there is no need to modify any files. BASIC programs start immediately upon opening them, without the need to use 'load' or 'run' to start the execution. Although BASIC Accelerator and Lazarus are running in 64 bit mode, FPC is still 32 bit, even though it has been optimized for 64 bit. However, the Lazarus

runtime is not always compatible with object Pascal code in 32 bit mode. On the other hand, FPC should always run with no more than 1 MB allocated to executable memory. Even if the executable memory is loaded into the RAM, the amount of RAM is limited by the size of the heap memory. For this reason, we recommend a file size of about 5 MB, and an available heap memory

of 200 MB or more. At the most, it is possible to use 5x5 MB of RAM. Changes to the default memory allocation for objects has been made on

Small and handy application for performing full BASIC to Object Pascal translations. Translated programs shall be executed using FPC + Lazarus. Any

number is a double precision floating point, not a decimal. Numerical operation is twice or fifth as fast as that of Binary mode of Decimal BASIC.

Translation Options: All BASIC statements can be included into Pascal using underscores instead of equal signs. Ctrl + S = Sort results alphabetically. Ctrl + W = Close & Load before creating file. Ctrl + F = Perform full validation. I am

really keen to see what this project will turn into, but then again every project I am involved with is just an excuse to see all the lovely people I know on the west coast of Scotland. And to see all the lovely places I have travelled to and the beautiful places I have had the pleasure of meeting you all at. So what will we be creating? Some sort of installation, which involves more than the original

course we are taking at the University of Stirling. But then again we all know that! I hope to be doing a little more coding than usual, and I should be able to do a few other things as well. But I shall have to see what happens there.// //

BASIC I hope that, anyone
of you may know about this
as a new project. But like
the past, i give my best
effort to make new cool
languages, compiler, IDE,
etc, as well as I don't know
about the new field. What i
have done? This is a
language for creating
beautiful and simple
programs as much as

possible. Have you noticed the following three things?

Parallax Basic is a BASIC-like environment which will be free for personal and commercial use. The source code of Parallax Basic is available and can be downloaded at [SourceForge.com](https://sourceforge.com).

KwikBASIC KwikBASIC is a BASIC version of Project 2000. The source code is available on SourceForge.com. Lisp Lisp is a programming language that is modeled on the way humans think of programs. Lisp is basically a combination of math and programming. The syntax is similar to that of Algol 60, and programming concepts are borrowed from Fortran and BASIC. Lisp contains

almost all the abstractions that we have come to expect in programming languages, including loops, if-then-else, function calls, recursion, variables, arrays, strings, and booleans. In addition, Lisp includes many constructs not found in other languages; e.g., macros, the more elaborate "forms" (elements of a Lisp expression), and "structs" (data structures). The language is a dialect of

Scheme, which is a general purpose programming language. The source code can be downloaded from

What's New In?

1. A small application to perform BASIC to Object Pascal conversions. 2. It displays numeric and alphabetic result in INPUT_LINE() mode. 3. It displays numeric and alphabetic result in

EXECUTE() mode. 4. When the application is executed in TERMINAL mode, it shows ASCII codes of the BASIC commands as results. 5. When the application is executed in DEBUG mode, it shows the string of .BAS file. 6. When the application is executed in FORMATTER mode, it shows formatting string of the passed argument. 7. When the application is executed in REPLAY mode,

it is possible to show the output of the executed BASIC program. 8. If the `COMPILE_DEBUG` option is turned on, the application is executed in `DEBUG` mode without showing any string, so that it can be debugged easily. 9. The application can be executed in either `ASCII_MODE` or `Binary_MODE`. 10. This application is supported by FPC + Lazarus. 11. The option of `LONG` for

argument is used. 12. It uses the dot to pass a string as an argument. 13. You can set the output format of the application. 14. Each character or numeric value of the input line is shown clearly as required. Note: 1. This application is the only one that is executed with or without Interpreter. 2. The result and the string of the .BAS file are shown in the same line in the output

window. 3. There are no restriction of the number of characters or alphabetic characters of the input line. 4. The number format is double precision. 5. The number format is in scientific notation. 6. If the application is executed in TERMINAL mode, it always shows the numeric value in INPUT_LINE() mode. 7. If the application is executed in TERMINAL mode, it always show the string in ASCII

code of the .BAS file in ASCII mode. 8. If the application is executed in debug mode, the process of evaluating arguments is repeated once for each numeric value. 9. The application is only BASIC to Pascal case conversion. 10. It does not show error message if the program is not found.
